Element-wise Exponentiation

Difficulty: **Easy**Accuracy: **73.86%**Submissions: **644+**Points: **2**Average Time: **15m**

Problem Description:

Given a Numpy array, write a function to perform element-wise exponentiation (raise each element to a power).

Numpy Schema:

You are given a 1-dimensional Numpy array and an integer for the exponent.

Example:

Input:

```
array = np.array([1, 2, 3, 4])
exponent = 2
```

Output:

```
array([ 1,  4,  9, 16])
```

Explanation: Each element of the array [1, 2, 3, 4] is raised to the power of 2.
