Matrix Multiplication

Difficulty: **Easy**Accuracy: **72.88%**Submissions: **685+**Points: **2**Average Time: **15m**

Problem Description:

Given two Numpy arrays (matrices), write a function to compute the product of the two matrices.

Numpy Schema:

You will be provided with two 2-dimensional Numpy arrays (matrices) that have compatible dimensions for multiplication.

Input Format:

The user is expected to input the matrix in the format "**a b , c d**" where a, b, c, d are the elements of the matrix, and the function will construct the matrix as:

```
[a b]
[c d]
```

Example:

Input:

```
matrix1 = 1 2 , 3 4
matrix2 = 5 6 , 7 8
```

Output:

```
[[19 22]
 [43 50]]
```

Explanation: The product of the two matrices is:

```
[1*5 + 2*7, 1*6 + 2*8]
[3*5 + 4*7, 3*6 + 4*8]
```
