Array Concatenation

Difficulty: **Easy**Accuracy: **76.08%**Submissions: **1K+**Points: **2**Average Time: **15m**

Problem Description:

Given two Numpy arrays, write a function to concatenate them along a given axis.

Numpy Schema:

You are given two 1-dimensional or 2-dimensional Numpy arrays and a chosen axis for concatenation.

Example:

Input:

```
array1 = np.array([1, 2, 3])
```

```
array2 = np.array([4, 5, 6])
```

```
axis = 0
```

Output:

```
array([1, 2, 3, 4, 5, 6])
```

Explanation: The arrays **[1, 2, 3]** and **[4, 5, 6]** are concatenated along axis 0.
