Transpose of a Matrix

Difficulty: **Easy**Accuracy: **85.12%**Submissions: **344+**Points: **2**Average Time: **15m**

Problem Description:

Given a 2-dimensional Numpy array (matrix), write a function to find its transpose.

Numpy Schema:

You are given a 2-dimensional Numpy array.

Example:

Input:

```
array = np.array([[1, 2], [3, 4], [5, 6]])
```

Output:

```
array([[1, 3, 5],  
       [2, 4, 6]])
```

Explanation: The transpose of the matrix $\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$ is $\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$.
